## ABSTRACT:

A system and method for detecting bacterial infections in the gastrointestinal tract is disclosed. In one embodiment, the system includes a first composition separated from a second composition. The first composition contains urea in powdered form. The second composition, on the other hand, contains an indicator. A biopsy of a gastric sample is first contacted with the first composition and then placed in the second composition. The second composition indicates the presence of an enzyme that, in turn, indicates the presence of bacteria. In an alternative embodiment of the present invention, a biopsy of a gastric sample is contacted with a single composition. The composition contains urea in a powdered form combined with a dry indicator. Besides urea and a dry indicator, the composition can also contain an anti-caking agent.

## ABSTRACT:

A system and method for detecting bacterial infections in the gastrointestinal tract is disclosed. The system includes a carrier having a first well and a second well. A first composition is disposed in the first well and contains urea in powdered form. A second composition is disposed in a second well and contains an indicator. A biopsy of a gastric sample is manipulated with a specimen-handling tool and is first contacted with the first composition and then placed in the second composition. The second composition indicates the presence of an enzyme, which, in turn, indicates the presence of bacteria.
